Differentiation

PAULO FAGANDINI

Definition

The function $f : \mathbb{R} \rightarrow \mathbb{R}$ is **differentiable** in $\hat{x} \in \mathbb{R}$ if the limit

$$\lim_{h \rightarrow 0} \frac{f(\hat{x} + h) - f(\hat{x})}{h}$$

exists. If it does, we denote it as $\frac{df(\hat{x})}{dx}$, or $f'(\hat{x})$, or $f_x(\hat{x})$.

Definition

The function $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is **partially differentiable** in $\hat{x} = (\hat{x}_1, \hat{x}_2, \dots, \hat{x}_n)$ with respect to x_j if the limit

$$\lim_{h \rightarrow 0} \frac{f(\hat{x}_1, \dots, \hat{x}_j + h, \hat{x}_{j+1}, \dots, \hat{x}_n) - f(\hat{x}_1, \dots, \hat{x}_j, \hat{x}_{j+1}, \dots, \hat{x}_n)}{h}$$

exists. If it does, we denote it as $\frac{\partial f(\hat{x})}{\partial x_j}$, or $f_{x_j}(\hat{x})$.

Definition

If $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is partially differentiable in each coordinate of \hat{x} , then its **gradient** is defined as:

$$\nabla f(\hat{x}) = \begin{pmatrix} \frac{\partial f(\hat{x})}{\partial x_1} \\ \vdots \\ \frac{\partial f(\hat{x})}{\partial x_i} \\ \vdots \\ \frac{\partial f(\hat{x})}{\partial x_n} \end{pmatrix}$$

The gradient indicates the direction of steepest ascent.

Definition

If $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$ is partially differentiable in each coordinate of \hat{x} , then the **Jacobian** matrix (also denoted ∇f , and Df) is defined as:

$$\nabla f(\hat{x}) = \begin{pmatrix} \frac{\partial f_1(\hat{x})}{\partial x_1} & \frac{\partial f_1(\hat{x})}{\partial x_2} & \cdots & \frac{\partial f_1(\hat{x})}{\partial x_n} \\ \frac{\partial f_2(\hat{x})}{\partial x_1} & \frac{\partial f_2(\hat{x})}{\partial x_2} & \cdots & \frac{\partial f_2(\hat{x})}{\partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_m(\hat{x})}{\partial x_1} & \frac{\partial f_m(\hat{x})}{\partial x_2} & \cdots & \frac{\partial f_m(\hat{x})}{\partial x_n} \end{pmatrix}$$

where in this case $f_i(\hat{x})$ represents the coordinate i of $f(\hat{x})$.

Definition

The **higher order derivative** is defined recursively, consider the derivative of f , of order n , on \hat{x} as,

$$f^{(n)}(\hat{x}) = (f^{(n-1)}(\hat{x}))'$$

$$f^{(1)}(\hat{x}) = f'(\hat{x})$$

Definition

The second partial derivative is defined as:

$$\frac{\partial^2 f(\hat{x})}{\partial x_i \partial x_j} := \frac{\partial}{\partial x_i} \left(\frac{\partial f(\hat{x})}{\partial x_j} \right)$$

It is well defined if both limits exist.

Definition

Let f be a differentiable function for any $x \in J$, then we say f is **differentiable in J** . If f' is well defined and continuous on J , we say that f is **continuously differentiable** on J or C^1 . If f' is differentiable at every $\hat{x} \in J$ we say f is **twice differentiable**, and if f'' is continuous, we say that f is **twice continuously differentiable** or C^2 in J .

In general, if $f \in C^n$ then we say that f is n -times differentiable, and $f^{(n)}$ is continuous.

Definition

The **Hessian** of a function f is the matrix with the second partial derivatives of f .

$$H(f, \hat{x}) = \begin{pmatrix} \frac{\partial^2 f(\hat{x})}{(\partial x_1)^2} & \frac{\partial^2 f(\hat{x})}{\partial x_2 \partial x_1} & \cdots & \frac{\partial^2 f(\hat{x})}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f(\hat{x})}{\partial x_2 \partial x_1} & \frac{\partial^2 f(\hat{x})}{(\partial x_2)^2} & \cdots & \frac{\partial^2 f(\hat{x})}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f(\hat{x})}{\partial x_n \partial x_1} & \frac{\partial^2 f(\hat{x})}{\partial x_n \partial x_2} & \cdots & \frac{\partial^2 f(\hat{x})}{(\partial x_n)^2} \end{pmatrix}$$

Conjecture

Let $f, g : \mathbb{R} \rightarrow \mathbb{R}$ differentiable, it holds that:

1. $(f + g)'(x) = f'(x) + g'(x)$
2. $(f \cdot g)'(x) = f'(x)g(x) + f(x)g'(x)$
3. $\left(\frac{f}{g}\right)'(x) = \frac{f'(x)g(x) - f(x)g'(x)}{g(x)^2}$
4. If $h(x) = f(g(x))$, then $h'(x) = f'(g(x)) \cdot g'(x)$. The glorious **chain rule!**
5. Let $f : \mathbb{R}^n \rightarrow \mathbb{R}$ and $g : \mathbb{R}^k \rightarrow \mathbb{R}^n$. Now let $h : \mathbb{R}^k \rightarrow \mathbb{R}$ as $h(x) = f(g(x))$, with $x = (x_1, \dots, x_j, \dots, x_k)$.

$$\frac{\partial h}{\partial x_j} = \sum_{i=1}^n \frac{\partial f(x)}{\partial (g(x))_i} \frac{\partial (g(x))_i}{\partial x_j}$$

With $(g(x))_i$ the coordinate i of the vector $g(x) \in \mathbb{R}^n$.

Theorem (Implicit Function)

Let $f : \mathbb{R}^n \rightarrow \mathbb{R}$ a function such that $f(z) = 0$, with $z = (z_1, z_2, \dots, z_n)$.

If $f_{x_1}(z) \neq 0$, then there exists a differentiable function $g : \mathbb{R}^{n-1} \rightarrow \mathbb{R}$ such that $z_1 = g(z_2, z_3, \dots, z_n)$, and $f(g(x_2, \dots, x_n), x_2, \dots, x_n) = 0$ for any (x_2, \dots, x_n) near (z_2, \dots, z_n) .

Theorem (Mean Value)

Consider a differentiable function $f : [a, b] \rightarrow \mathbb{R}$, then there is $c \in [a, b]$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Conjecture

Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be differentiable. f is strictly increasing if and only if $f'(x) > 0$ for any $x \in \mathbb{R}$.

Definition

Given $x_0 \in \mathbb{R}$ and $f : \mathbb{R} \rightarrow \mathbb{R}$ differentiable (at least k times). The k – order Taylor series at x_0 is:

$$T(x_0, f)(x) := \sum_{i=0}^k \frac{f^{(i)}(x_0)}{i!} (x - x_0)^i$$

Conjecture (l'Hôpital's rule)

Let f and g be differentiable functions such that one of the following two conditions hold:

- $\lim_{x \rightarrow x_0} f(x) = 0$ and $\lim_{x \rightarrow x_0} g(x) = 0$, or
- $\lim_{x \rightarrow x_0} |f(x)| = \infty$ and $\lim_{x \rightarrow x_0} |g(x)| = \infty$.

Then $\lim_{x \rightarrow x_0} \frac{f(x)}{g(x)} = \lim_{x \rightarrow x_0} \frac{f'(x)}{g'(x)}$.
